

INFORMATION

MESUCO-SALT-CLAY

ATTAPULGITE

DESCRIPTION

MESUCO-SALT-CLAY is a pure grade attapulgite clay, selectively mined and processed to fully conform to API Standard 13A and OCMA Specification DFCP-1.

APPLICATION

MESUCO-SALT-CLAY is an effective viscosifier in all makeup waters ranging from fresh to salt saturated. The greater the rate of shear of the drilling fluid system the greater the viscosity and yield of the product.

RECOMMENDED TREATMENT

Approximately 16 ppb (17.1 kg/m^3) of MESUCO-SALT-CLAY is required to develop a 15 centipoise mud or a funnel viscosity in the range of 34-36 sec/qt. Exact concentration will depend upon the viscosity required.

For fluid loss control it is recommended to use FILTRACEL or FILTROL.

PACKAGING

MESUCO-SALT-CLAY is normally packaged in 50 lb or 100 lb net export bags for Messina's United States produced product or, 25 kg or 50 kg net export bags for the European produced material. Other types of bags, palletization, overwrapping, banding, etc., are available on request.

MESUCO-SALT-CLAY is a Messina trademark
